2. Source code Mọi người hãy Subscribe kênh youtube dưới đây nhé để cập nhật các video mới nhất về kỹ thuật và kỹ năng mềm Introduction: The ngIf directive is used to show or hide parts of an angular application. 1. Suppose there is a bound property called "student". So when the condition is true for ngIf, the content of the unlabelled gets displayed. Create an angular app and move to src/app. Show / Hide Table of Contents There was an error loading this resource. Please try again later. When the expression evaluates to true it runs/displays the template given in the "then" clause. First, we need to define a variable say "check" in app.component.ts with a value true or false.import { Component } from '@angular/core';@Component({ selector: 'app-root', templateUrl: './app.component.html', styleUrls: ['./app.component.css']})export class AppComponent { check:boolean = true;}After defining a variable, move to app.component.html and create two divisions using bootstrap classes. 1 2 3 4 5 6 7 8 9 10 11 import { Component } from '@angular/core'; @Component({ selector: 'app-root', templateUrl: './app.component.html', styleUrls: ['./app.component.css'] }) export class AppComponent { title: string = 'ngIf Example'; showMe: boolean; } Tiếp đến ta có file template html như sau: 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 Simple example of ngIf Show ngIf ShowMe is checked ShowMe is unchecked Using elseBlock ngIf then else This is not rendered ShowMe is checked Using elseBlock ngIf then else This is not rendered ShowMe is unchecked Using elseBlock using hidden content to render, when the condition is true using hidden property binding content to render, when the condition is false. The hidden attribute hides the selected element from the DOM but the element still exists in the DOM. We have declared check to be true so we get a green division saying condition true. 1 2 3 các thẻ html sẽ được hiển thị nếu điều kiện là đúng Chúng ta có thể sử dụng thuộc tính hide để làm điều ngược lại như sau: 1 2 3 content to render, when the condition is true Sự khác nhau ở chỗ ngIf sẽ xóa hoàn toàn phần tử web ra khỏi DOM. The modern webdeveloper's platform Show / Hide Table of Contents There was an error loading this resource. If the student is null, it will return error undefined. Yes, they do the same work but there is still a difference. It can be added to any tags, it is a normal HTML tag, template, or selectors. using hidden property binding Chúng ta sử dụng ngIf và sử dụng ngModel để lấy giá trị của showMe. Nếu true thì ta sẽ show ra dòng chữ ShowMe is checked còn ngược lại là ShowMe is unchecked. Sử dụng then else trong ngIf 1 2 3 4 5 6 7 8 9 10 11 This content is not shown content to render when the condition is true. Còn hide thì không xóa hẳn phần tử đó ra khỏi DOM. 6. Nếu check box bị check thì ta sẽ thay đổi giá trị, content to render when condition is false. The ngIf directive doesn't hide elements with CSS. User name: {{ user.name }} export class AppComponent { data = { user: { name: 'Superman' }, }; }; Show / Hide Table of Contents There was an error loading this resource. When the expression is falsy, NgIf removes the div from the DOM, destroying that element. So if we check for null before accessing sub-property, we will prevent error using "ngIf". {{ student.name }} {{ student.name }} Output:SantoshngIf vs Hidden: You might wonder why do we have to use ngIf when we have hidden attribute in HTML5. It adds and removes them physically from the DOM. Handy when you check value or get it from async pipe. You can add or remove an element from the DOM by applying an NgIf directive to that element (called the host element). If there is nothing in else clause, it will be default display blank.Syntax:ngIf with an "else" block when condition is true, when condition is false It internally creates two, one for "then" statement and another for "else". Or when the expression evaluates to false it displays the template given in the "else" clause. Ta có component class có chứa giá trị showMe. Mặc định là true. Whereas ngIf gets rid of the selected part from the DOM. The modern webdeveloper's platform Nội dung bài viết Chào các bạn,hôm nay anh sẽ hướng dẫn mọi người cách tạo ngIf là như thế nào? We are trying to access the "name" sub-property of the student which has value "Santosh". The first division is for the "true" condition and the one inside is for the false condition. It doesn't intervene with CSS. Show this only if "check" is trueOutput:Show this only if "check" is true Store the value locally. Bind the directive to a condition expression like isActive in this demo. ngIf là gì Chúng ta sử dụng ngIf để xóa hoặc thêm một phần tử trên web dựa vào điều kiện có thỏa mãn hay không. Sử dụng if else trong ngIf 1 2 3 4 5 6 7 content to render, when the condition is true content to render, when the condition is false 4. It has support for all the logical operators like AND, OR, NOT, etc.ngIf helps to avoid can't read property error of undefined. Video Demo 7. Mặc dù trên giao diện ta thấy phần tử đó bị mất đi. Sử dụng phủ định trong ngIf 1 2 3 content to render, when the condition is false 3. 5.Ví dụ ngIf Ta sẽ làm ví dụ về kiểm tra một check box có bị check hay không? Move into the angular app and write command npm install bootstrap. When the isActive expression returns a truthy value, NgIf adds the div to the DOM. And when false, the labelled runs.Approach:As we know, ngIf else statement works on a variable that has a boolean type. If the check was false, a red division saying condition false would be displayed. Condition true Condition false Output:Output:Advantages:Programming language's "if" block supports logical operators so it does "ngIf". It is a structural directive meaning that it includes templates based on a condition constrained to boolean.

The ng-app directive is used to initialize the AngularJS application. The ng-init directive is used to initialize the application data. The ng-model directive binds the value of HTML controls (input, select, textarea) to application data, and the ng-hide directive is ... AngularJS ng-click is an In-Built AngularJS directive that is mainly used to handle the click events on the HTML view and processing the data in the controller as per requirements. The ng-click directive can be used with multiple HTML elements such as button, input, select, checkbox, etc. There is a set of built-in directive in AngularJS which offers functionality to your applications. You can also define your own directives. Directives are special attributes starting with ng- prefix. Following are the most common directives: ng-app: This directive starts an AngularJS Application. ng-init: This directive initializes application ... Aug 12, 2019 · So in this next section, we'll take a deeper dive on ngFor, \* and the element to explain in more detail what's really happening here. When using an asterisk (\*) in our templates, we are informing Angular we're using a structural directive, which is also sugar syntax (a nice short hand) for using the element. Angular Tutorial Architecture overview and concepts Angular 2 is now known as Angular is the new front end framework and is the successor to the most popular AngularJS. The Angular is an open-source and helps us build dynamic & single-page applications (SPAs). In this article, we will give you a brief introduction to Angular. ... Introduction to Angular Read More »
